

ABSTRACT

A pants-shaped absorbent product, such as incontinence pants or pull-ups, intended for males, has a front section, a rear section, a crotch section, an elastic waist region, an absorbent element intended to cover the penis of the user, and a liquid-tight outer layer. The front section has an elastic member, which enables the front section of the product to be pulled down during use, counter to the action of the elastic member, to a position in which the upper limit edge of the front section is situated below the penis of the user. The absorbent element is configured with one or more deformation zones, which enable parts of the absorbent element to be drawn along when the front section of the product is pulled down. The front section of the product and the absorbent element are arranged to be returned by the elastic member to their original usage position.
